

Compatibility Guidelines for Mixing TwinN & Other Agricultural Compounds During Application

GENERAL INFORMATION

- ♦ TwinN microbes are resilient to most stresses once they have entered the plant and root zone. However, during application in the mixing tank or applicator, they may be exposed for several hours to other agricultural compounds that the producer wishes to co-apply. The effects of the exposure to these compounds when in the application tank can reduce viability of the TwinN microbes.
- ♦ If the agricultural compound you wish to use is listed as incompatible with TwinN, do not attempt to co-apply. Instead, apply TwinN to the crop and allow a minimum of 24 hours to pass before applying the second compound.
- ♦ If TwinN is applied to the roots, for example by fertigation, then it is safe to apply any other agricultural compounds to the foliage even if they are listed as incompatible in the table below.

Important Notes

1. If the product that you want to co-apply is not listed here, then consult your TwinN distributor. Meanwhile, presume it is not compatible.
2. The products were tested at the concentrations listed in the table. Higher application rates, different formulations, or other factors may result in incompatibility.
3. Different brand names with the same active constituents may have the same compatibility, however, the varying solvents or carriers may result in incompatibility.
